Field of the Invention The present invention is related generally to a gas turbine engine, and more particularly to a method of assembling a gas turbine engine. 2. Description of the Related Art Including Information Disclosed Under 37 CFR 1.97 and 1.98 A gas turbine engine includes a fan section, a compressor section, a combustor section, and a turbine section. The fan section is positioned at the front, the compressor section at the rear, the combustor section in the middle, and the turbine section at the rear. The compressor section, the combustor section and the turbine section are disposed in a cowling which is located above the fan section. A plane, which includes the longitudinal axes of the fan, compressor, combustor and turbine sections of the engine and the longitudinal axis of the turbine section of the engine, is a major engine design plane. In an exemplary, relatively large-sized, axial flow gas turbine engine which is quite common and quite successful, the turbine section has a very large diameter. The turbine section also has a large axial length. Consequently, one or more large turbine sections are typically disassembled into a number of relatively smaller, shorter sections, such as two or three relatively shorter turbine sections. The assembled engine can then be more easily handled, shipped, and installed. The compressor section and the turbine section are relatively heavy. Consequently, a large axial length can increase the length of the frame which supports the various sections of the engine. Increasing the length of the frame can decrease the maximum engine diameter. However, the frame,
