Back Office Tools Autodesk BackOffice Tools provides several web and mobile applications for manipulating and sharing drawing data. The BackOffice tools provide a web-based version of AutoCAD (based on AutoCAD LT), a dedicated mobile app for Android, Apple and Windows, a web-based collaboration system using OneNote, an online drawing library similar to Google's open source project Open Drawings, and a Drawing Services API for integrating third-party software. Calculator The CALC application, formerly known as "CALC Professional", is part of AutoCAD and AutoCAD LT, and is the standard mathematical software available in the latter. Cartesian plotter This application provides tools for plotting Cartesian geometry. Content Manager In addition to providing tools to manage, view and open CAD files, the Content Manager application provides features such as support for iAutodesk - a plugin platform that allows third parties to add functionalities to AutoCAD or Autodesk Inventor. Inventor, as one of the applications included in the AutoCAD product suite, and sister product AutoCAD Mechanical, provides a range of functionalities that provide information on the structure and properties of objects. Cloud CAD The cloud version of AutoCAD is called AutoCAD 360 Cloud. The cloud application is available for free from Autodesk web site and requires an annual subscription. Cloud repositories Autodesk Cloud repositories allow users to easily share drawings and collaborate with others. The cloud repository is a web-based version of the traditional drawing store, offering both easy to use and secure ways to share drawings. There are three types of cloud repositories supported by AutoCAD. Desktop Desktop (archived) stores are archives of user drawings shared using the traditional drawing store. The latest versions of drawings are automatically retrieved and available on the desktop. Desktop Repositories are protected by a username and password. Users are limited to working on only their drawings by a user name and password and are not allowed to download or

In the automotive manufacturing industry, the fabrication of automotive assemblies such as car bodies is conducted by forming a variety of components (or body portions) of an automotive vehicle, such as a car body and a chassis, from a starting material which may be steel, steel plate, or the like. The components of the automotive vehicle are formed by pressing, forging, or similar processes. During such processes, a large number of parts may be required to be fabricated in the same tool in order to increase productivity. However, with the recent trend toward increasing automation of process, increases in the number of parts have been accompanied by a decrease in the number of tools. Thus, a new method of designing the tool and a method of manufacturing the parts, which are suitable for the increase in the number of parts, are demanded. Furthermore, with the recent trend toward increasing automation of process, increases in the number of parts have been accompanied by a decrease in the number of tools. Thus, a new method of designing the tool and a method of manufacturing the parts, which are suitable for the increase in the number of parts, are demanded. With the reduction in the number of tools, there are instances in which a plurality of parts to be fabricated are connected to one another. These kinds of connected-parts are processed by a single tool, and thus may include parts that differ in specification. However, when a tool is made to have a structure suitable for the connected-parts, there may be instances in which the whole tool cannot be used, because the structure of the tool is complicated. In order to avoid the complication of the structure of the tool, Japanese Laid-Open Patent Application No. H9-305282 discloses a press apparatus which utilizes a rubber plug mechanism as a means of connecting a plurality of components to be pressed. The press apparatus includes a tool
