Go to the option dialog, select the scripting icon and write down the following: It is possible to change the values of the key, please read the documentation. Autocad This script will automate the creation of the object and save it into a layer in the timeline. It will place the layers created with the Script on top of each other. If the layers already exist, they are placed in the new layer. To create the first layer, set the options as follows: Once done, click on the timeline to show the layers. Layers created with this script have no option to be turned off, so they cannot be skipped. Therefore, if you need to skip the layer, for example because of a bug, it is better to make the layer into an independent object with the option Update mode: None. The script The script takes one parameter which is the folder of the.kmz-file containing the VRM. Step by step 1 Import the vrm file to the project: Save the file containing the VRM into your project Run the script:
