commands are created using Application commands and can generally be used on any object. The menu command for "File Open" would be called "File". Application commands can be accessed through the ObjectARX or Visual LISP APIs, although not all user interface control methods are supported. Model commands and Database commands are commands or actions performed against the model or database. The Menu command "File Open" would be an example of a Model command. They are often used for allowing the user to manipulate an external database. Commands generally have an input and an output, and consist of blocks of code with a name that the user can see or modify. Some commands may have a verb form; these are usually taken to refer to the same command as its infinitive. Hand-mediated effects during haptic exploration of a novel three-dimensional object. Four conditions were examined during haptic exploration of a novel three-dimensional (3D) object: (1) hand resting, (2) object resting, (3) object rotating, and (4) object rolling. Differences in hand motor responses (hand-lengthening and grasp amplitude) were observed during the object resting and object rotating conditions. During the object resting condition the hand lengthened and the hand's grasp angle increased. During the object rotating condition the hand remained stationary and the angle of the hand's grasp decreased. These effects are interpreted as hand-mediated effects that occur during exploration of a novel object. The present invention relates to a lighting system and, more particularly, to a a1d647c40b
